## Description of the security update for SharePoint Server 2019: February 12, 2019

This security update contains the following improvements and fixes:

- When you run a search query that contains the SortList query parameter by using the REST interface, the query fails and generates a SearchServiceException exception. This can occur because the SortList parameter is case-sensitive.
- When you index a document for search, the number of unique tokens per field is now increased from 10,000 to 1,000,000 before the document field is truncated.
- The Search Service Application interface is now public. It is now possible to create a custom search application that uses the Search Service Application interface.
- This update makes improvements to enable the new Japanese Era in SharePoint Server 2019 when it becomes available.
- This update fixes an issue that affects SharePoint integration with Office Online Server. When you select the **Open in Word Online** option for a Word document, the document does not appear. This fix also improves the translation and localization of various strings in the modern features, such as modern lists and modern libraries.
- This update fixes the Help link on some SharePoint Central Administration pages to point to Central Administration help instead of user help.
- When you create a team site or classic team site in the central administration of SharePoint Server 2019 on-premises, the description references Office 365. This is inaccurate. The description is now more accurate.
- This update adds the ability to change a task's duration type through the client-side object model (CSOM) after the task is created.
- You can't set the description of a lookup table value to blank through the client-side object model (CSOM).
- You can't get all the details of a dependency link, such as the lag duration and project UID properties, through the client-side object model (CSOM).

- After a v2v upgrade from SharePoint Server 2016 to SharePoint Server 2019, PerformancePoint and User Profile service application databases do not have the expected compatibility level.
- Because the multi-tenancy feature is unavailable in SharePoint Server 2019 on-premises, this update removes the multi tenancy option on the central administration page (Irmadmin.aspx) in SharePoint Server 2019.
- Blob caching fails because the new logic to replace metabase access requires the local administrator permission for the application pool account.

## [February 12, 2019, update for SharePoint Server 2019 Language Pack \(KB4462170\)](#)

This update includes the following improvements and fixes:

- When you create a team site or classic team site in the central administration of SharePoint Server 2019 on-premises, the description references Office 365, which is inaccurate. The description is updated to be more accurate.
- This update fixes the Help link on some SharePoint Central Administration pages to point to Central Administration help instead of end user help.

## [Description of the security update for SharePoint Enterprise Server 2016: February 12, 2019](#)

This security update contains the following improvement in SharePoint Server 2016:

- This update makes improvements to enable the new Japanese era in SharePoint Server 2016 when it is available.

This security update contains the following improvement in Project Server 2016:

- This update adds support in the client-side object model (CSOM) for setting the EnterpriseProjectType of a project by using the REpresentational State Transfer (REST) Application Programming Interface (API)..

This security update contains fixes for the following nonsecurity issues in SharePoint Server 2016:

- Assigned Badges icons are unexpectedly hidden in a discussions list, a Members list and the My Membership web part in a SharePoint community site.
- When you try to add a SharePoint hosted app in a SharePoint Online site, the app is not displayed on the **App from your organization** page.
- When you run a search query, the alternate access mapping function is always called. This call is expensive and may lead to a high CPU load on the server.
- When you run a search query by using the REST interface that contains the **SortList** query parameter, the query may fail with a **SearchServiceException** exception because the **SortList** parameter is case-sensitive.

## Description of the security update for SharePoint Enterprise Server

2013: February 12, 2019

This security update resolves vulnerabilities in Microsoft Office that could allow remote code execution if a user opens a specially crafted Office file. To learn more about these vulnerabilities, see [Microsoft Common Vulnerabilities and Exposures CVE-2019-0668](#) and [Microsoft Common Vulnerabilities and Exposures CVE-2019-0670](#).

### February 12, 2019, update for SharePoint Enterprise Server 2013 (KB4011702)

This update makes improvements to enable the new Japanese era in SharePoint Enterprise Server 2013 when it is available.

### February 12, 2019, update for SharePoint Enterprise Server 2013 (KB4461602)

This update makes improvements to enable the new Japanese era in SharePoint Enterprise Server 2013 when it is available.

### February 5, 2019, update for Office 2013 (KB3172473)

This update makes improvements to enable the new Japanese era in Access 2013 when it is available.
