November 8, 2016, update for SharePoint Foundation 2013 (KB3127936)

- This fix allows admins to change the way that the URLs are normalized in the crawler. By default, the case is preserved. With this fix, the admins can choose to have case-insensitive URLs, so URLs that only differ in case will be considered the same.
- User profiles are migrated incorrectly during [WSSSync](#).
- Accessibility issue for the style gallery within the ribbon.
- In Chrome, when there's nothing in the element, the cursor jumps in the Content Editor Web Part.
- After you add the [TableBinding object](#) on matrix, Excel 2013 crashes if the source is already bound and then converted to matrix.
- When you try to add a database to an availability group, there's no logic to check whether the database is already backed up. This results in taking redundant backups.

- If a large list has many items that have uniquely-defined permissions, list view pages take a long time to display results.
- An error occurs when you unpublish a document with the last published version.
- Fixes an issue in which the Access Control Lists (ACLs) in a site are updated when you change the permission level title.

[November 8, 2016, update for SharePoint Foundation 2013 \(KB3127938\)](#)

- Translates five time zone names which are added recently in multiple languages in SharePoint 2013.

[November 8, 2016, update for SharePoint Server 2013 \(KB3127928\)](#)

- This fix allows admins to change the way that the URLs are normalized in the crawler. By default the case is preserved. With this fix the admins can choose to have case-insensitive URLs so that URLs that only differ in case will be considered the same.
- Improves translation of newsfeed description text in German to make sure that the meaning is accurate. Also translates new Taxonomy messages in multiple languages in SharePoint 2013.
- Introduces a new Out of the Box (OOTB) managed property DocumentLink for supporting Multi-Purpose Internet Mail Extension (MIME) file path search in folders.
- Introduces a new drop-down menu with options **Edit** (in native client), **Edit in browser** and **Download** that works across all major browsers in search result page of SharePoint 2013.
- Fixes the following issues:
 - User profiles are migrated incorrectly during [WSSSync](#).
 - Accessibility issue for the style gallery within the ribbon.
 - Pinned and reused terms are left behind in the orphaned term store and cannot be removed.
 - Fixes an issue that limits community member count to 20 members.
 - Allows usage of custom result source GUID for remote SharePoint search and people search.

- An error occurs when you create navigation link from one site collection pointing to another site collection URL when the first site collection name is the prefix of the second one. For example, adding navigation link from any page of site collection "foo" to "/sites/foobar/...".
- Crawling content by using custom connectors may cause Title managed property to be populated incorrectly.
- Improves robustness of parsing documents by using IFilters when the document contains embedded resources.
- You cannot create new document set with date in the local format when you are using regional setting other than the date-format MM/DD/YYYY.
- You do not correctly escape quotation mark when a list item is exported from Preservation Hold list.

[November 8, 2016, update for SharePoint Server 2013 \(KB3115176\)](#)

- No Microsoft KB notes available

[November 8, 2016, update for Project Server 2013 \(KB3127937\)](#)

- Tasks, resources, or assignments, which are created, for example, with client-side object model (CSOM), and use the same UID as the Project UID, cannot be edited in Project Web App (PWA).
- Making changes to timesheet lines may change the TASK_PUBLISHED_UID field of other timesheet lines.
- List properties such as MSPWAPROJUID were not set as expected. Therefore, accessing these properties returns NULL.

[MS16-133: Description of the security update for Word Automation Services on SharePoint Server 2013: November 8, 2016](#)

- This security update resolves vulnerabilities in Microsoft Office that could allow remote code execution if a user opens a specially crafted Office file. To learn more about these vulnerabilities, see [Microsoft Security Bulletin MS16-133](#).

[November 8, 2016, update for SharePoint Server 2013 \(KB3118356\)](#)

- After you add the [TableBinding object](#) on matrix, Excel 2013 crashes if the source is already bound and then converted to matrix.

November 8, 2016, update for SharePoint Server 2016 (KB3127940)

This public update delivers the first feature pack (Feature Pack 1) for SharePoint Server 2016 that contains the following features:

- Administrative Actions Logging
- MinRole enhancements
- SharePoint Custom Tiles
- Hybrid Auditing (preview)
- Hybrid Taxonomy (preview)
- OneDrive API for SharePoint on-premises
- OneDrive for Business modern experience (available to Software Assurance customers)

The OneDrive for Business modern user experience requires an active Software Assurance contract at the time that it is enabled, either by installation of the public update or by manual enablement. If you don't have an active Software Assurance contract at the time of enablement, then you must turn the OneDrive for Business modern user experience off. See [New features included in the November 2016 Public Update for SharePoint Server 2016 \(Feature Pack 1\)](#) for more information.

- The time it took to patch and upgrade to the [September 2016](#) and [October 2016](#) public updates was much longer than usual. This has been fully fixed for the November 2016 public update by refactoring how we package the updates.

If you haven't installed the September 2016 or October 2016 public update, you can expect patching and upgrade to the November 2016 public update to take the same time as usual. If you have installed the September 2016 or October 2016 public update, you can expect patching to the November 2016 public updates to still take longer than usual as we convert the files installed by those updates into the new packaging format. As soon as that's complete, you can expect patching to future public updates to take the same time as usual.

- Improves performance when you use Content Search Web Part in Internet Explorer.
- Updates translations of hashtag in Danish to make sure that the meaning is accurate in SharePoint Server 2016.
- Translates some terms in multiple languages to make sure that the meaning is accurate.

- Enables query logging to record original query text.
- Adds a new feature to allow recall to be excluded from the link update group of search indexes which may contain unrelated content based on your queries.
- Search results aren't ranked correctly for certain queries and result sets.
- Fixes the following issues:
 - URLs that are copied from a search result page are invalid if multiple consecutive white spaces are included.
 - The Alert Me link can't be hidden through PowerShell.
 - Performance issue when you connect to a SharePoint Server 2010 Web Front End (WFE) server by using a SharePoint Server 2013 search backend.
 - If you add a custom search vertical on a SharePoint team site, the default search verticals, such as Everything and People, disappear from the search settings. Meanwhile, this update also adds the possibility of inheriting search verticals from the parent team site.
 - You can't request or get refiners through a remote SharePoint search result source.
 - After you upgrade from SharePoint Server 2013 to SharePoint Server 2016, Excel Web Parts that are created in SharePoint Server 2013 can't be loaded.
 - When you use Chinese taxonomy refiners to search items on a SharePoint Server 2016 site, the search appears broken.
 - When you select a refiner, incorrect recall occurs if the Search UI language and the document language are mismatching.
 - Managed account password change fails after you have [KB3167679](#) and [KB3177108](#) installed.
 - In certain circumstances, an error page is displayed when you browse to an ASPX page that has a code block, despite an appropriate PageParserPath element in the web.config file. The error message that resembles the following is logged to ULS:

System.Web.HttpException: Code blocks are not allowed in this file.

- If the search result source references the request URL, the sitemap generation fails for a SharePoint Publishing site collection (the Search Engine Sitemap job fails).

- Self-assigned timesheet lines may display an incorrect TASKUID in the OData feed.
- If the web.config file size is larger than 250 KB which is the default file size limit, the SharePoint farm can't be visited because IIS doesn't load the web.config file.

November 8, 2016, update for SharePoint Server 2016 (KB3127942)

- Translate some terms in multiple languages to make sure that the meaning is accurate.
- Update translations of hashtag in Danish to make sure that the meaning is accurate for SharePoint Server 2016.
- Translate field name of the custom app launcher tiles feature in multiple languages for SharePoint Server 2016.
- Update branding names of SharePoint Server 2016 in multiple languages.
