## August 11, 2015, update for SharePoint Foundation 2013 (KB3055015)

- This update adds the hybrid crawl feature. For more information, see [Cloud hybrid search capability in SharePoint Server 2013](#).
- Fixes the following issues:
  - Some client and SharePoint integrated functions do not work in Chrome that has the NPAPI plugins enabled. For example, the **Create a workflow in SharePoint designer** function does not work.
  - When you use the **Quick Edit** function to edit items in a document library, no error message is displayed if the entered data is invalid.
  - When you set the PreserveID attribute to **True** for some Microsoft SharePoint Server 2013 items, duplicate document IDs may be generated. In this case, when you try to open an item, you may be redirected to a search page that contains multiple items instead of browsing to the item directly, or you see an incorrect document opened.
  - When you upload a file whose name contains invalid characters to a SharePoint Server 2013 site, you do not receive a warning message.
- You cannot add more than 500 recurring events to a calendar list on a SharePoint Server 2013 site.
- When you try to use in-place search to search items in a list that contains multiple pages, the search can find items on the current page, but cannot find items on a different page.
- When the Current Events view for an Event list includes a multivalued lookup column, you may receive the following error message:

```
Attempted to use an object that has ceased to exist. (Exception from HRESULT: 0x80030102 (STG_E_REVERTED))
```

- When you use an invalid content-length header to change a view in minimal download strategy (MDS) mode, you receive the following error message:

Cannot complete this Action.

- After a site collection does backup, restore, or copy operations, site collection scoped event receivers of the site collection are lost.

## August 11, 2015, update for SharePoint Foundation 2013 (KB3055019)

Fixes the following issue:

- A configured SharePoint 2010 workflow does not start automatically as expected on SharePoint Server 2013.

## August 11, 2015, update for SharePoint Server 2013 (KB3055002)

- This update adds the hybrid crawl feature. For more information, see [Cloud hybrid search capability in SharePoint Server 2013](#).
- Improves the error message that occurs when you try to create a declare record from a document set.
- Adds [hybrid followed sites feature](#) to SharePoint Server 2013.
- Fixes the following issues:
  - After you enable company extraction on the body managed property, results that are not companies are displayed in the refiner panel of the search results page.
  - When you search items from a Microsoft SharePoint Server 2010 farm that consumes search results from a SharePoint Server 2013 search service application, you may receive an unhandled exception if there is an item whose title contains more than 50 characters and an ampersand "&."
  - When you use Chinese taxonomy refiners to search items on a SharePoint Server 2013 site, the search appears broken.
  - When you set the PreserveID attribute to **True** for some SharePoint Server 2013 items, duplicate document IDs may be generated. In this case, when you try to open an item, you may be redirected to a search page that contains multiple items instead of browsing to the item directly, or you see an incorrect document opened.
  - When you try to use in-place search to search items in a list that contains multiple pages, the search can find items on the current page, but cannot find items on a different page.

- When you use the **Other Value** text box to filter refiners for a search result, the count is displayed as zero. This issue occurs if you enable the results counter on the File Type refiner that is a multiple value refiner.
- When you check a page that has a web part with a TODAY token in a query, you may see the search contents of the previous day.
- After you add a file without an extension to a document set, shared properties are not inherited from the document set.
- When you click the **Go to search results** link in a search alert email message for a localized search center, you receive the following error message:

Page not found.

- When you parse a Word document, high CPU utilization occurs on the noderunner.exe process

## MS15-081: Description of the security update for Word Automation Services on SharePoint Server 2013: August 11, 2015

- This security update resolves vulnerabilities in Microsoft Office that could allow remote code execution if a user opens a specially crafted Office file. To learn more about these vulnerabilities, see [Microsoft Security Bulletin MS15-081](#).

**Note** To apply this security update, you must have the release version of [Service Pack 1 for Microsoft SharePoint Server 2013](#) installed on the computer.

For a complete list of affected versions of Microsoft Office software, see [KB3080790](#).

## August 11, 2015, update for SharePoint Server 2013 (KB3054989)

Fixes the following issue:

- When you run the **Create PDF/XPS Document** function for a workbook in Microsoft Excel 2013, Greek or Cyrillic characters are changed from the MS Gothic font to the Arial font.

## MS15-081: Description of the security update for Office Web Apps Server 2013: August 11, 2015

- This security update resolves vulnerabilities in Microsoft Office that could allow remote code execution if a user opens a specially crafted Office file. To learn more about these vulnerabilities, see [Microsoft Security Bulletin MS15-081](#).

**Note** To apply this security update, you must have the release version of [Service Pack 1 for Microsoft Office Web Apps Server 2013](#) installed on the computer.

For a complete list of affected versions of Microsoft Office software, see [KB3080790](#).
